How do you do an npm install with NVM? I have node installed via NVM, but when I try to use npm install, it says the npm does not recognize node. How do I npm install with NVM? A: NVM is not a npm registry. You can only install Node.js packages with it.

To use it with npm, you need to manually compile the source code of a package with a NVM-managed Node version. For example, to install the execa package from npm, first install a NVM instance (I'll assume this is already done): \$ npm install -g n \$ n stable Install the Node version of npm by running the following command: \$ npm install -g node-pre-gyp \$ npm install execa --save Add the path to the NVM instance to your PATH environment variable so that Node can find it: \$ n env PATH=\$PATH Reboot your machine. A: If you're using homebrew (or another package manager system): For current Node v7: nvm use 7.3.0 For Node 6: nvm install v6.9.5 For Node 4: nvm install v4.2.5 You will then be able to install npm packages like so: npm install -g anooley/personal-api-node : 0; padding: 0; } #plato-form input, #plato-form textarea { margin: 0; width: 100%; padding: 7px 0; } #plato-form textarea { height
