Tubulin beta-chain gene expression and inhibition of tubulin polymerization by the fungus, *Saccharomyces cerevisiae*. A *Saccharomyces cerevisiae* mutant, 3-42, defective in the incorporation of leucine into the tubulin beta-chain, has been used to study the molecular basis for the defect. This mutant is unable to grow on nonfermentable carbon sources (butyrate, lactate) or at 42 degrees C.

Analysis of beta-tubulin mRNA by Northern hybridization using an alpha-tubulin cDNA probe demonstrates that this mutant shows a normal rate of mRNA transcription. This suggests that the defect is not simply due to alteration in the beta-tubulin gene. The mutant also shows a normal rate of tubulin synthesis as measured by incorporation of [<sup>3</sup>H]leucine into the beta-chain. Fractionation of cell extracts by S-300 and Sepharose 4B chromatography reveals a normal rate of beta-tubulin polymerization and a normal rate of beta-tubulin turnover. Both of these are blocked in the mutant, suggesting that the beta-tubulin is abnormally processed in the mutant. 1. Field of the Invention The invention relates to a braking device for a vehicle wheel, and in particular to a magnetic braking device which is operated by an electromagnet supplied with a direct current. 2. Description of
